The scFv was obtained by PCR amplification of cDNAs for 195/AD3 when the regions and cloning in vector pDAP2. 193/AD3 is 195/AD3 when the regions and cloning in vector pDAP2. 193/AD3 is 195/AD3 when the regions and cloning in vector pDAP2. 193/AD3 is 195/AD3 when the regions and cloning in vector pDAP2. 193/AD3 is 195/AD3 when the regions and cloning in vector pDAP2. 193/AD3 is 195/AD3 when the regions and cloning in vector pDAP2. 193/AD3 is 195/AD3 when the regions and cloning in vector pDAP2. 193/AD3 is 195/AD3 when the regions and cloning in vector pDAP2. 193/AD3 is 195/AD3 when the received in the proceeding activative. Administration leads to an increase in the proceeding activative frixa, even in the presence of increase in the proceeding activative frixa, even in the presence of FVIII or FVIII, and in the case of FVIII in the absence of FVIII or FVIII, and in the case of FVIII in the absence of FVIII or FVIII, and in the case of FVIII in the absence of FVIII or FVIII, and in the case of FVIII in the absence of FVIII or FVIII, and in the case of FVIII in the absence of FVIII or FVIII, and in the case of FVIII in the absence of FVIII or FVIII and derivatives are used in a 195/AD3 is 195/AD3 in the case of FVIII in the case of FVIII in the case of FVIII in the case of FVIII in the case of FVIII in the case of FVIII in the case of FVIII in the case of FVIII in the case of FVIII in the case of FVIII in the case of FVIII in the case of FVIII in the case of FVIII in the case of FVIII in the case of FVIII in the case of FVIII in the case of FVIII in the case of FVIII in the case of FVIII in the case of FVIII in the case of FVIII in the case of FVIII in the case of FVIII in the case of FVIII in the case of FVIII in the case of FVIII in the case of FVIII in the case of FVIII in the case of FVIII in

Sequences of the invention are useful in expessing chimerised 31.1 antibodies, which can be used for treating pancreatic cancer or for diagnosing pancreatic carcinoma. They are also used in antibody therapy. The present sequence is chimeric 31.1 antibody heavy chain variable region.
                                                                                                                                                                                                                                                  Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                    New nucleic acid encoding light and heavy chain variable regions of antibody 31.1, useful for expressing chimerized 31.1 antibodies for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The variable heavy (VH) and variable light (VL) genes of the 741F8 canti-c-erbB-2 monoclonal antibody (MAb), were isolated from the CCDNA of the parental 741F8 hybridoma line. A two single chain Fv CC (sFv) gene was constructed by connecting the VH and VL genes with a CDNA sequence endcoding a polypeptide linker. A synthetic DNA duplex cancering the C-terminal amino acid sequence, (G1)4-Cys was constructed, and the resulting 741F8 anti-c-erbB-2 two sFv inserted into an expression vector. The resulting gene, which encodes the Cresent sequence, was transformed into B. coil, and protein corression induced by the addn. of 1FVG to the culture medium. CC accepts in vivo imaging, and drug targetting experiments. The custom prod. is a honocimer, in which both fragments target the same antigen, therefore giving greater binding avidity and clonger tissue retention times, compared to individual sFv protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC This sequence is a single chain anti-c-erbB-2 antibody (scFv)

C derived from hybridoma 741P8. The protein product includes a C-terminal

CC tail [Gly4-Cys in some constructs. Single-chain antibodies can be

CC produced using a novel method which comprises culturing an immmortalised

CC eukaryotic cell having transfected DNA sequences (encoding the protein

CC effector vectors containing a non-native reporter DNA (encoding the scFv)

CC and viral sequences to promote transcription and translation (e.g. the

CC adenovirus EIA and VAI genes as shown in ANT91831 and AAT91834

CC respectively) are used. The scFv that is produced, when properly folded,

CC adenovirus EIA and the mono- or bi-functional binding activity. The method

CC has a structure with mono- or bi-functional binding activity. The method

CC is especially used to produce single-chain antibody fragments (scFv),

CC e.g. for imaging tumours or delivering therapeutic agents to them,

CC particularly breast and ovarian cancers that express the c-erbB-2

CC introjenter scFv are used in model studies and for treating digoxin

                                                                                                                                                                                                                                                                                                                                                                g
                                                                                                                                                                                                                                                                                                                                                                                        δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to methods of increasing production of a single-chain binding protein, especially a single chain antibody, by generating enkaryotic cell lines containing DNA encoding either a viral transcription activator protein that acts on and stimulates a viral promoter controlling the expression of DNA encoding the cannot binding protein, such as the adenovirus Ad2 BIA protein encoded by the sequence AAT78873, or an RNA sequence able to promote translation of the RNA transcript from the heterologous gene, such as the adenoviral VAI gene (AAT78876).

The sequence presented here is the amino acid sequence of the active-c-rbB2 single chain antibody 741. The coding sequence was constructed by amplifying the variable heavy and light chain genes which were then cloned into a pUC vector. For secretion from mammalian chis more closed antibody 5202 (AAT78880) or from PacI (AAT78881).

This was constructed by connecting the Vh and VI genes with a DNA sequence encoding a 14 residue polypeptide linker. 741F8 is a monoclonal antibody useful in targeting c-erbB-2 antigen. This dimeric construct can be used in the methods of invention of imaging a preselected antigen expressed in a mammal. The methods are used in magnetic resonance imaging of c-erbB-2 or related antigens in cancer diagnosis. The biosynthetic constructs have enhanced properties as in vivo targetting agents in comparison with intact monoclonal antibodies or their Fab fragments. The dimeric constructs permit the in vivo targetting of an epitope on an antigen with greater apparent avidity, including greater tumour specificity, tumour localisation and cumour retention properties than that of the Fab fragment having the same
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 07-OCT-1993;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents single chain binding site molecule (SFV). The sequence was expressed to exemplify the invention, which is a method for the expression of poorly expressed genes in an immortalised eukaryotic cell. This cell contains transfected DNA sequences operatively integrated into its genome. The transfected DNA sequences encode a viral transcription promoter linked to a non-native reporter sequence encoding a single chain binding protein. The promoter is activated by a viral transcription activator protein. The cell allows the production on a commercial scale of proteins encoded by non-native hard to express
                                                                              Anti-c-erbB-2

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents an anti-c-erbB-2 sFv'. C-erbB-2 is an antigen that is overexpressed on the surface of tumour cells. An antibody designated 741F78 binds c-erbB-2. Variable heavy and light sequences of antibody 741F8 are connected, together with a linker, to produce the present single chain Fv gene. Anti-c-erbB-2 sFv' exemplifies the invention. Dimers of the single chain Fv are used for targeted delivery of drugs or imaging agents (e.g. cytotoxins, prodrugs or 99m-technetium) to antigen-expressing cells, particularly for treatment or diagnosis of tumours (especially of ovary or breast).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  07-OCT-1993;

The chimeric antibodies can be used for any purpose for which the original murine MAbs can be used, with the advantage that they are more compatible with the human body. They are esp. used for the diagnosis and treatment of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              04-OCT-1988;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The heavy chain variable region (AAW06217) of mouse monoclonal antibody KM10 is the product of a cDNA clone (AAF43442) isolated from a KM10 hybridoma cDNA library. Mea KM10 (IgG1) binds to an antigen that is expressed on the surface of human colon, stomach, pancreas and oesophagus carcinomas, but not on most normal adult issues. The heavy chain and light chain variable regions (see also AAW06218) of KM10 can be linked to human constant regions and expressed in transformed host cells. Novel mouse-human chimeric antibodies (see also AAW06209-16) can be produced that have specificity to human tumour antigens for use in the treatment and diamonate of human carcon.
                                                            Heavy chain variable region; murine antibody KM10; antibody ING-1; chimeric immunoglobulin; human tumour antigen; chimeric antibody;

The sequence was used to create chimeric mouse-human immunoglobulins which recognise the human tumour antigen bound by antibody ING-1 (produced by hybridoma cell line ATCC HB 9812). The chimeric antibodies also have an antigen-binding site that competitively inhibits the binding of antibody ING-1, and mediate complement-dependent cytolysis of target cells or antibody-dependent cellular cytotoxicity to target cells. The chimeric antibodies can be used for therapeutic purposes in the treatment of human cancer.

The invention describes an antibody comprising a human constant region and a variable region having specificity for the human tumour antigen to bound by the ING-1 antibody, where the ING-1 is produced by cell line CC the ING-1 for the human tumour antigen. The antibody has the same affinity as CI immunoassay method for detecting an antigen in a sample by contacting a CC label-detectable antigen in the sample with the antibody, detecting the CC use in an imaging method for revealing the presence of the antigen; for CC use in an animal by contacting the antigen with the apart of the antigen; for CC uspected of containing the antigen, detectably with a part of the animal CC suspected of containing the antigen, detecting the label and relating the coarrying an antigen by contacting the antibody with a part of the animal CC carrying an antigen by contacting the cells with the antibody and CC diagnosis and therapy. The chimeric antibodies are useful in tumour CC diagnosis and therapy. The chimeric antibodies bind to the surface of the main tumour cells but do not bind detectably to normal cells, e.g., CC fibroblasts, endothelial cells or epithelial cells in the major organs. CC me high biological activity of the chimeric antibodies against human cells but do not bind detectably to normal cells, e.g., comply that these antibodies may mediate selectivity with normal tissues to comply that these antibodies may mediate selectivity with normal tissues to cantionate to clearance enhances the potential utility of these chimeric antibodies increases their resistance to creatable to chemeric antibodies increases their resistance to cantibodies, as well as their derivatives, in tumour diagnosis and contained to use diagnosis and contained to use diagnosis and contained to use diagnosis and contained to use diagnosis and contained to use of the contained antibody heavy chain cantibod en antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antibody for detecting antigen in animal or killing cells carrying antigen comprises human constant region and variable region having specificity for human tumor antigen bound by ING-1 antibody -

                                                                                                                                                                                                                                                                                                                                                                cDNA for mouse anti-human MHC-III MAb L243 (ATCC HB 55) heavy chain variable region was cloned by PCR. Clone pB1702 was obtained that contained a VH insert having the sequence given in AAR00426; the deduced amino acid sequence is given in AAR04257. Altered antibodies have been prepared that retain immunosuppressive properties but show reduced binding to PCRI. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        L243; heavy chain; VH; monoclonal antibody; MAb; MHC-II; major histocompatibility complex class II; immunosuppressive; variable region; Fc receptor I; FcRI; antibody engineering;

The WAIA elicits an anti-ganglioside response and produces antibodies which induce cytotoxic destruction of cancer cells bearing the gangliosides. It can be used for treating cancers partic, melanomas. It can also be used as an immunomodulator to enhance anti-cancer immunity, suppress organ transplant rejection and suppress autoimmune disease. The MAIA can also be used in the diagnosis of cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Chimeric murine-human anti-idiotype monoclonal antibodies useful as immuno-modulators for treating and diagnosing cancers, and for suppressing organ transplant rejection and auto:immune

Sequence 2, Application US/10138727A

Publication No. US20030157054A1

GENERAL INFORMATION:
APPLICANT: Gillies, Stephen
APPLICANT: Gillies, Stephen
APPLICANT: Qian, Susan
ITITE OF INVENTION: Recombinant Tumor Specific Antibody And Use Thereof
FILE REFERENCE: LEX-019
CURRENT APPLICATION NUMBER: US/10/138,727A
CURRENT APPLICATION NUMBER: US 60/288,564
PRIOR APPLICATION NUMBER: US 60/288,564
PRIOR APPLICATION NUMBER: US 60/288,564
PRIOR APPLICATION STEP: 2001-05-03
NUMBER OF SEQ ID NOS: 42
SOFTWARE: Patentin version 3.0

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
